CHEST :

The heart size is normal.

The pulmonary vascularity is a little sparse bilaterally, but particularly in the right mid zone.

Given the patient's young age, pulmonary embolism would normally be very unlikely, however, assessment of D-dimer levels would be suggested. Is there any possibility of a right to left cardiac shunt? The cardiac size and shape appear normal.

There is a small protrusion from the 1st rib on the right, which is likely to be a normal variant.
