Dear Ms Halliday and Mr King

Thank you for coming to meet with Dr Corinne Love, Ms Justine Craig (Clinical Manager for Intrapartum Services) and myself on 21st March 2012. We discussed events around the time of Frazer's birth and we thought it might be helpful to write down a summary of our discussion.

Shona came in to the Simpsons in normal labour and was assessed as being suitable for intermittent monitoring. Frazer's heart beat was normal in triage and initially in labour ward: there were no concerns that this was anything but a low risk labour.

Frazer's heartbeat was listened to around every 15 minutes as is our guideline for intermittent auscultation. Before Shona went to the toilet Frazer's heart beat was listened to for 3 minutes and all was well. The midwife, Maria Wood, tried to listen in 15 minutes later, while Shona was on the toilet, but she could not locate the heartbeat. Her immediate thought was that something was wrong with the sonic aid and she went to get another one. Justine Craig discussed this with Maria Wood after the event, and Maria raised the thought that she should have gone straight for help or a continuous monitor. In Justine Craig's opinion anyone in the same situation would have probably done the same: there was no cause for alarm as baby and Shona had been absolutely fine. We discussed what would have happened if Shona had been continuously monitored, and we felt that the monitor would have been unplugged if she was in the toilet. Therefore it would not have made a difference to the speed of realising something was wrong. However there was a delay of about 5 minutes while the midwife went for another sonic aid, and it is possible that this time might have been saved if continuous monitoring had been in place. Frazer's beartbeat was then heard again about 25 minutes after the previous auscultation and was slow at about 20-30 beats per minute.

Once it was identified that Frazer's heartbeat was present but slow, medical staff attended quickly because a slow heart rate is a sign of 'fetal distress', which means that Frazer had reduced oxygen levels and / or blood flow. Shona was examined and had not made significant progress so the decision was very quickly taken to deliver her by emergency caesarean section. During delivery Frazer was noted to have passed meconium in the womb, although this is likely to have been a sign of fetal distress, rather than the cause of it.

On review of the notes there seems to be no obvious explanation for the drop in Frazer's heartbeat or the reason for developing fetal distress. It was explained that sometimes if the waters break the cord can be compressed or that if labour progresses very rapidly and the baby's head descends quickly through the pelvis, this can cause a slowing of the heart rate. Neither of these events happened. The cord was not wrapped around Frazer's neck. There was no particular abnormality identified with the placenta to have accounted for the events that occurred.

Dr Boardman went on to discuss that when Frazer was born he showed signs of having low oxygen levels and poor circulation, consistent with the signs of fetal distress that had been recorded when he was in the womb. At birth these signs

G file

manifest as a slow heart rate with no breathing, and low muscle tone. The resuscitation team placed a breathing tube through Frazer's mouth into his lungs, so that he could be supported by a breathing machine.

Frazer responded well to resuscitation measures and his heart rate and oxygen levels were normal within about 5 minutes. The blood tests that reflect the function of the circulation started to improve, as expected when the heart rate and oxygen levels are restored.

The signs described above, along with early blood tests from Frazer, are consistent with the diagnosis of hypoxic ischaemic encephalopathy (HIE), which is a problem with brain function that occurs when there is loss or reduction of blood flow and/or reduced oxygen levels in the blood around the time of birth. This diagnosis also explains why he went on to develop seizures in the hours and days after birth. You will be aware from discussions at the time that this can be a life-threatening diagnosis and can lead to cerebral palsy among survivors. Frazer received intensive care and cooling treatment for 72 hours, because the latter is known to improve the outcome for some babies with HIE.

At the time that Frazer was resuscitated it was apparent that he had inhaled a small amount of meconium. We discussed that this is a sign of fetal distress rather than a cause of it. It did not lead to severe lung disease in Frazer's case.

Pneumothorax is a recognised complication for babies who require ventilatory support, and it is unfortunate that Frazer experienced this complication. It was detected quickly from the X ray, and was treated by placing a chest drain into the right side of the chest. There is no sign that the pneumothorax led to worsening hypoxia after birth, and it is unlikely that it contributed significantly to the problems with his brain.

The MRI that Frazer had is typical of the type of brain injury that is seen in children with HIE that has quite a sudden onset in the womb, and the electroencephalogram (EEG) showed that there was no seizure activity at the time that he was discharged from hospital. We discussed that he is now showing signs of asymmetric arm use and that this could be a sign of movement problems related to HIE in the newborn period, because we know that HIE can lead to injury in parts of the brain that control movement and posture. However the effects of HIE on the development of movement and posture can take eighteen months to 2 years to become apparent, so it is usual to continue regular neurodevelopmental assessments into early childhood. Frazer is under regular review in the out-patient clinic at the Simpson for this reason.

We ended by discussing that the underlying reason for why fetal distress arose in the first place remains unknown. Looking forward, it will be important to continue regular assessments of Frazer so that he can receive appropriate help at the right time as and when needs arise. At present, this is physiotherapy, and I understand that this referral is in place. We hope that this letter answers the questions you raised. Please do not hesitate to raise further questions with us at any time, or with the doctors who see Frazer in the out-patient clinic.

With kind regards.

Yours sincerely

Dr James Boardman
Consultant neonatologist

Signed on behalf of Dr Corinne Love (Consultant Obstetrician) and Ms Justine Craig (Clinical Manager for Intrapartum Services).

Outpatient Clinic Letter

Dear Dr P. Midgley,

Further to your letter dated 6 December 2011, I met up with this very pleasant couple on 17 January 2012. I was not involved with the clinical care of Ms Halliday, I am writing this letter on behalf of Dr Alexander whose work I am covering as a Locum Consultant. The couple are understandably very disappointed with the outcome of their recent pregnancy, but seem to be coping well.

I understand from the neonatal discharge summary dated 10 September 2011 that Master Frazer was diagnosed to have severe neontal encephalopathy, pneumothorax and acute renal failure during his care in the Neonatal Unit. This meeting was arranged further to a request from yourself after Master Frazer King was reviewed on follow-up in the Neonatal Unit.

We have had a long and thorough discussion today in relation to intrapartum events. Though I was not involved with her care, we went through the documentation on TRAK during her delivery.

I have tried to answer most of the questions that the couple asked today, however I was unable to give them a definite cause for Frazer's problems, as this is unclear from the intrapartum events noted.

The couple seemed quite understanding and satisfied with the obstetric side of things. However, they still had a lot of queries in relation to the neonatal care, possible meconium aspiration and pneumothorax and requested if they could have a meeting with yourself and the midwife who cared for them during labour.

Therefore I will be arranging a further meeting with the neonatologist, myself and Justine Craig who will be representing the midwife. I would be grateful if you could kindly inform my secretary on the number below, or email me directly, of the available dates. I would like to keep you informed that I will be leaving this Trust by mid February. It would be helpful if we could try and meet up prior to this. If this is not possible then I shall hand over to Dr Love, Clinical Lead in Obstetrics.

If you need further information, please do not hesitate to get in touch with myself.

I wish the couple all the best for the future.

Thanking you.

With kind regards.

Yours sincerely

Clinical Summary

This was the first pregnancy of this 35 year old lady. The pregnancy was booked with an EDD of 17.08.11 giving a clinical gestation of 40+11 weeks. Ultrasound scan and routine anomaly scan performed. The serum AFP level was low. Amniocentesis was not performed. Delivery on 28.08.11.

Specimen

Placenta

Macroscopy

The specimen received is a singleton placenta with an eccentrically inserted 32cm length of cord with 7 coils and three vessels. The extraplacental membranes appear ragged but translucent. The trimmed weight of the placenta is 509g and it measures 18 x 15 x 2cm. Random sections taken.

Specimen trimmed by: Dr M J Evans

Microscopy

This appears to have been an uneventful pregnancy at 40 weeks gestation. Block only. If there is a clinical reason for detailed histopathological investiagation please contact the reporting consultant.

PRINCIPAL DIAGNOSIS/PROCEDURE
Emergency Caesarean section for fetal bradycardia
Delivery of baby boy 28/8/11
Now Para 2+0
Delivery at 41+4 gestation

TREATMENT
This lady was admitted on 28/8/11 in labour. Her CTG was initially reassuring however the baby then had a significant bradycardia and was taken to theatre for an emergency caesarean. Baby did not have any resiratory effort initially and was taken to the neonatal unit for further assessment and monitoring.
EBL 900ml in theatre - Post-op Hb was 101.

Name: ..... D.O.B.: .....

REGULAR THERAPY

- **Write clearly in block capitals, using a black ballpoint pen**
- **Use approved names for medicines**
- **Never alter a prescription**
- **Route of administration**

The only acceptable abbreviations are:

IV - intravenous	SL - sublingual	NG - nasogastric
IM - intramuscular	PR - per rectum	ID - intradermal
SC - subcutaneous	PV - per vagina	TOP - topical
INHAL - inhaled	NEB - nebulised	

Never abbreviate ORAL or INTRATHECAL

Specify RIGHT or LEFT for eye and ear preparations

- **Write the medicine dose clearly**

The only acceptable abbreviations are:

g - gram mg - milligram ml - millilitre

all other doses must be written out in full e.g. micrograms

Avoid decimal points e.g. 100 micrograms (not 0.1 mg) If unavoidable, write zero in front of the decimal point

Prescribe liquids by writing the dose in mg

For 'as required' medicines, state the symptoms to be relieved, the minimum time interval between doses and the maximum daily dose

Reassesed by: _____

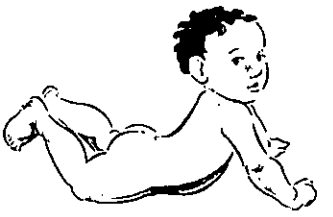
1. File this patient's risk factors assessment in the medical notes and document in ICP or Care Plan (as appropriate)
2. Check the guideline for EPIDURAL/SPINAL anaesthesia (refer to Appendix 3 of VTE guideline).
3. BASELINE PLATELET count on all patients before starting heparin (including enoxaprin) and then alternate day platelet count up to 3 weeks if therapy more then 5 days.
4. Prescribe the required prophylaxis (including GECs/TEDs) on the patient's Medicine Chart.
5. Document reasons clearly if prophylaxis is WITHHELD.
6. REVIEW patient RISK FACTORS regularly (discuss with Primary Care Team if prophylaxis must be continued

All patients admitted - use Inpatient Risk Assessment form to manage of VTE prophylaxis

Parenthood Sessions
Dalkeith Area 2011

We would like to invite you to participate in our preparation for parenthood sessions: Dalkeith Health Centre.

Aim of the sessions:



To prepare you and your partner for this life changing event.
To meet other parents-to-be.
Share ideas, experiences and learn new skills.
It will be an opportunity for midwives and health visitors to address your agenda.
This programme consists of four sessions lasting approx **1.5-2hrs**
Each session will start at **14.00hrs**

The best time to attend classes is between 32 – 36 weeks of pregnancy.
Listed below are the dates available.

PLEASE CAN YOU PHONE FIRST TO BOOK A PLACE FOR THE CLASSES. COMMUNITY RECEPTION NO. 561 5510

Group 1	Group 2	Group 3	Group 4	Group 5	Group 6

Dear

We write to inform you that should your baby require to be born by caesarean section, this procedure will either be performed at the Simpson's Centre for Reproductive Health at the Royal Infirmary or at St John's Hospital, Livingston.

Each woman will be assessed individually and full consideration will be given to the complexity of her case and the area in which she lives when planning operating lists.

The move is designed to prevent delays, as the number of babies being born in Lothian grows higher than ever before.

The decision will be discussed in full at your Consultant Consultation appointment.

In the meantime, should you wish to discuss this further then please contact your community midwife in the first instance.

Yours sincerely

Maria Wilson

Screening for fetal abnormalities

During your pregnancy you will be offered several tests to check on your baby's health. These include ultrasound scans and may include blood tests to screen for risk of fetal abnormalities including Down's Syndrome and Spina Bifida.

Your local maternity team will explain what ultrasound scans will be offered to you and you will be asked to complete the appropriate consent for these tests.

The ultrasound scans you are likely to be offered by your local maternity services are:

☑ Dating scan ☑ Nuchal translucency scan 11-13 weeks ☑ Detailed scan at 20 weeks

☐ Growth scan as required ☐ Placental site scan as required ☐ Other

Consent for screening tests offered in pregnancy (Down's Syndrome and Neural tube defects)

I have received the information leaflet 'A Guide to the Screening Test for neural tube defects and Down's Syndrome' and have had an opportunity to discuss the tests I am being offered with a health professional. I understand the reasons for the tests and the consequences of the results. I also understand the significance of not having these tests performed. I am aware that my decision whether or not to have these tests will not affect the quality of care delivered by health care professionals during my pregnancy.

☑ I wish ☐ I do not wish to be screened for the risk of Neural tube defects by Scan.

☑ I wish ☐ I do not wish to be screened for the risk of Down's Syndrome

Your preferences for labour and the birth of your baby ✍

Please use the section below to write down your preferences for labour and birth. Alternatively you may wish to attach your own birth plan here. Plans for labour and birth will be individual. They depend on your wishes, your health, your circumstances and what is available at your maternity unit or in your home. You will probably find it helpful to discuss these issues with your birth partner, your midwife, and/or members of your maternity care team during your pregnancy.

During labour, members of your maternity care team will read this section and discuss it with you so they understand your preferences. However you may need to keep an open mind if complications arise for you or your baby. If this happens, your midwife or doctor will discuss events with you and your birth partner. They will be able to inform you of your options in your particular circumstances.

How do I feel about labour and birth?
What are my expectations?

Who do I want with me during labour and birth?

My environment for labour and birth
Things I might want to consider: privacy, quiet, my own music, food and drink, lighting, comfort aids such as pillows, bean bags, chairs or a mattress.

If everything is straightforward, how do I want my baby's heartbeat to be monitored during labour?
e.g. at intervals with a hand-held 'doppler' or ear-trumpet (Pinard stethoscope).
Do I understand when continuous electronic monitoring of my baby's heartbeat may be advised?

How will I cope with pain?
Things I might want to try: relaxation and breathing, changing my position, massage, water (shower, bath or water pool), complementary therapies, a T.E.N.S. machine, 'gas and air', injection of a morphine-related drug or an epidural? (Note: an epidural service is not available in all maternity units and at all times).

Vaginal examinations to assess my progress during labour
My feelings about these are:

How would I like to give birth?
My position for birth - kneeling, standing, squatting or sitting upright ?
Discovering the sex of my baby - do I want to find this out for myself?
Would I like my placenta to be delivered with or without an injection? (An injection often helps to reduce bleeding).

After my baby's birth
(Note: skin-to-skin contact with your baby is usually encouraged straight after birth)
Would I like my baby to have Vitamin K?

Other questions or special requirements that I have 

If you have given birth before, you may want to think about your experiences. Please write down anything you would like your midwife or other maternity staff to know. 

Discussion of preferences for labour and birth/issues arising
(Maternity care staff - please sign and date all entries)

Signature: ..... Date ..../..../....

Preparing for birth - what to pack in your bag 

Here are some suggestions for what to take to the maternity unit. Please remember to take your Pregnancy Record, as it is very important. If you are having a home birth, your midwife will discuss other things that you will need to prepare.

For the birth	After the birth	
• comfortable clothes • music • snacks and drinks • toiletries • phone numbers • phone cards or change • camera • • • •	• clothes/nightwear for you • underwear • maternity bra • sanitary towels • breast pads • • • • • •	• clothes for going home • baby clothes – sleep suits, vests, scratch mits, hats and shawl • nappies • • •
		Please note If you are travelling by car your baby will need a properly fitted car seat for all journeys.

Your ultrasound scans

Details of any ultrasound scans that you may choose to have will be entered below or the computer print out results of your scans will be attached.

ANTENATAL SCREENING REPORT FOR FETAL DOWN'S SYNDROME

Combined chance of Down's Syndrome at term 1 in 2121

The outcome of the screening test has shown that your baby has only a low chance of Down's Syndrome. Therefore no further action is needed. Please remember that this is a screening test and does not completely rule out the presence of this condition.

TEST DETAILS PROVIDED		LABORATORY DATA	
Date of sample	14/02/2011	Date of sample receipt	15/02/2011
Date of scan	14/02/2011	Gestation at sample date	13wks 5 days
Crown rump length	78 mm	Maternal age at EDD	35.78 yrs
Nuchal translucency	1.9 mm	Age related chance	1 in 362
Current smoker	Yes	Free beta HCG mom	1.99
Maternal weight	71 kg	PAPPA mom	2.05
Family origin	Caucasian	Nuchal translucency MOM	1.38

Comments

Please check this report carefully and ensure that the test details provided have been recorded correctly. If incorrect information has been used the screening test result may be invalid.

For more information refer to the National Protocol: Fetal Anomaly amd Down's Syndrome Screening (2010).

INFORMATION FOR RhD NEGATIVE WOMEN

Several blood tests are undertaken during pregnancy for the benefit of the pregnant woman and her baby. The Scottish Blood Transfusion Service has performed tests to determine your blood group. A card giving details of your blood group is enclosed above, which can be detached for safe keeping.

Q. Why is it important to know the blood group of a pregnant woman?

A. First, to provide blood for transfusion without delay if there is unexpected bleeding during pregnancy or at delivery, and second, to identify women who are RhD negative (Rhesus negative).

Q. Why is it important to identify women who are RhD negative?

A. During a normal pregnancy blood from the baby can enter the mother's bloodstream, the amounts are small and not felt by the mother. Sometimes when this happens the mother forms an antibody. These antibodies are harmless to the mother and the majority are harmless to the baby, but a few are capable of affecting the baby's red cells, the most important of these anti-D which can only develop in RhD negative mothers who are carrying an RhD positive baby. Fortunately, giving an injection of anti-D immunoglobulin can largely prevent the formulation of anti-D.

Q. When is anti-D immunoglobulin injection necessary?

A. Routinely after delivery of an RhD positive baby. It may also be required after a miscarriage, threatened miscarriage or abortion, a medical procedure such as amniocentesis, a heavy fall or other abdominal injury and vaginal bleeding. The anti-D immunoglobulin should be give within 72 hours of any of the above events.

If you should lose this card, please write to the above address for replacement, informing us of your full name and DOB. If you want further information, please ask your GP or midwife.

Never let this card be used by another person as the particulars relate only to you.

Consent for Chlamydia Screening in Pregnancy

I have received the information leaflet 'CHLAMYDIA INFECTION – Screening in pregnancy for women aged 25 years old or younger.' I have read it and had a chance to discuss the test I am being offered with a health professional.

I understand the purpose of the test and the importance of the results.

I understand that I may freely decide not to have the test if that is my preference.

☑ I wish to have a test for Chlamydia

☐ I agree to be contacted at the address about the result of this test

Obstetric Observation Chart

NHS Lothian

Consultant: _____

Date chart commenced: _____

This is chart number _____ this admission

Booking weight _____ kgs BMI _____

ASU: _____

Attach a patient Addressograph here
or

Name: Shona Halliday

DOB: 06 11 75.

CHI No: 06 11 75 1143.

An Early Warning Score (SEWS) must be calculated every time observations are recorded and ALL components completed. If SEWS score >= 4 then follow flow chart and increase frequency of observations to at least hourly.

SEWS >=4	SEWS>=6 or rapid deterioration
↓	↓
Inform midwife in charge and obstetric senior trainee	Inform obstetric and anaesthetic senior trainees (consultants if above not readily available)

CAUTION

The SEWS relates to the SYSTOLIC BP only. If there are concerns re preeclampsia then separate documentation of DIASTOLIC pressure must be made along with target BP. Action should then be taken even if the SEWS score does not 'trigger'.

Intrathecal or Epidural Opioid

Drug:	Dose	Route	Time

Patient Controlled Analgesia (PCA)

(PLEASE ALSO PRESCRIBE ON DRUG CHART)

Drug:	Dose: / 50 ml 0.9% NaCl	Concentration: mg/ml	Antiemetic:	Dose:
InitialPCA bolus :	Lockout time:	Signature	Name	Date/Time
Amended to: Amended to:				

IMPORTANT

IF INTRATHECAL / EPIDURAL OR PCA OPIOIDS, PLEASE ENSURE THAT RESPIRATORY RATE, SEDATION, PAIN AND NAUSEA SCORES ARE RECORDED HOURLY FOR THE FIRST 12 HOURS AFTER INITIAL DOSE

Oxygen 2l/min via nasal prongs should be continued with PCA therapy

Respiratory Depression	Nausea/vomiting	Pruritus:
If respiratory rate less than 8 or the patient is difficult to rouse immediately call Anaesthetist and Obstetric Senior Trainee If APNOEA Respiratory arrest - Dial 2222	**1st line:** Cyclizine 50mg iv/im 8 hrly (if not in PCA) **2nd line:** Dndansetron iv 4mg 6hrly **3rd Line:** Prochlorperazine IM 12.5mg **4th Line:** Dexamethasone iv 8mg	Ondansetron 8mg iv/im Naloxone 100mcg ivincrements titrated to effect Chlorphenamine 4mg oral

PERSISTENT PAIN - 6 OR ABOVE - CONSIDER MEDICAL REVIEW

Reorder Ref: WLT1016-Obs

How to calculate SEWS Score (document after each set of observations)

- **Do not add pain score to SEWS Score.**
- Record standard observations (RR, SpO_2, Temp, BP, HR, AVPU).
- Note whether observation falls in shaded "At Risk Zone". Score as per SEWS key.
- Add points scored and record total "SEWS Score" in bottom row of chart.
- Action as per guidelines on front of chart.

If RR >24	Review patient / CXR +/- gases / PEF (Peak Expiratory Flow) etc → Definitive Therapy
If SpO_2 sats <93%	Review probe ? accurate Review patient → prescribe oxygen on drug chart if indicated, consider ABGs.
If Temp >38	Blood cultures Other cultures Early antibiotic therapy if sepsis suspected.
If Systolic BP<100	Review monitoring *(cardiac / oximetry / urine output / invasive BP etc).* IV Access Review patient / drug kardex.
Consider:	IV fluid bolus and reassess. Care in preeclampsia. TREAT UNDERLYING CAUSE

Consider:	Hypovolaemia	Obstructive	Distributive	Cardiac
	Dehydration	*PE*	*Sepsis*	*Arrhythmia*
	Blood loss	*Tamponade*	*Anaphylaxis*	*Pump failure*

If Pulse >130	Review monitoring *(cardiac monitor indicated)* IV Access Review patient / ECG / electrolytes → Definitive Therapy
It responds to pain only or unresponsive	Assess airway, BM, GCS, neuro observation chart, review patient / kardex.
If BM <4	Give Oral Carbohydrate / IV Dextrose. Consider checking urgent laboratory blood glucose.

HOW TO ASSESS BP IN A PREGNANT PATIENT

Initial BP measurement must be manual
Appropriate sized cuff should be used
Diastolic BP reading is when the sound **disappears**

Systolic BP >160mmHg	Recheck manually in 15 mins and assess patient If BP still elevated – CONTACT SENIOR TRAINEE
Diastolic BP >100mmHg Or >20mmHg from booking	Recheck manually in 15 mins and assess patient If BP still elevated – CONTACT SENIOR TRAINEE
Diastolic BP >110mmHg	CONTACT OBSTETRIC SENIOR TRAINEE IMMEDIATELY
Urinalysis ++ protein	CONTACT OBSTETRIC SENIOR TRAINEE IMMEDIATELY

When assessing the patient the following symptoms may indicate severe pre-eclampsia and require further action

Headache	Visual disturbance	Facial oedema	Breathlessness
Epigastric pain	Right upper quadrant pain	Vomiting	Generalised oedema

Nausea Score (0-3)

0 = **No Nausea**
1 = **Nausea** (consider anti-emetic)
2 = **Nausea/Vomiting** (administer anti-emetic)
3 = **Persistent Nausea &/or Vomiting** (contact Dr).

PERSISTENT NAUSEA &/OR VOMITING: USING GUIDELINES PRESCRIBE/GIVE ANTI-EMETICS. REVIEW.

Amended to:					

SCORING SYSTEMS

Score	Pain on movement	Sedation	Nausea	Pruritus
0	No Pain	None, patient alert	None	No Pruritus
1	Mild pain, it does not distress me	Mild, occasionally drowsy; easy to rouse	Mild nausea, no treatment required	Mild pruritus, it does not distress me
2	Moderate pain, it distresses me a bit	Moderate, frequently drowsy; easy to rouse	Nausea / vomiting, helped by treatment	Moderate pruritus, it distresses me a bit
3	Severe pain, it distresses me a lot	Severe, somnolent; difficult to rouse	Persistent nausea / vomiting despite treatment	Severe pruritus, it distresses me a lot
S	Score S if sleeping normally	Normal sleep, stirs to light touch	Score S if sleeping normally	Score S if sleeping normally

RESPIRATORY DEPRESSION

If Respiratory Rate is 8/min or less, or if the patient is very difficult to rouse:
Inform Obs. SHO and Anaesthetist on call: Bleep 2204
Place in recovery position, ensure airway is clear and that patient is receiving oxygen.
Have 0.4mgs of Naloxone available, diluted to 10ml in 0.9% saline.
If Naloxone is considered necessary:
the recommended dose is increments of 1 ml (40 mcg) intravenously

APNOEA - Dial 222 - Commence Basic Life Support.

NAUSEA / VOMITING

Score 2/3: **First line therapy is:**
Cyclizine 50 mg. I/V or I/M
8 hourly p.r.n. **(if not in PCA)**

If any antiemetic ineffective after 30 mins give additional I/V or I/M antiemetic sequentially as follows:
e.g. Ondansetron 4 mg.
Prochlorperazine 12.5 mg (only by deep I/M injection).
Metoclopramide 10 mg.
Dexamethasone 10 mg.

PRURITUS

Score 3: **Suggested therapies are:**

I/V, I/M or oral Ondansetron 8 mg.

I/V Naloxone in 100 mcg increments, titrated to effect. *(this may only provide short-term relief and may need to be repeated).*

Oral chlorpheniramine 4 mg

ROUTINE AND SPECIAL OBSERVATIONS

Respiratory rate (counted over a full minute), pain score (at rest and on movement), sedation score, nausea score, volume left in syringe and delivered dose must all be recorded hourly. While patient is sleeping, score sedation as S if patient stirs to light touch.

Pump N° 106854

17 May 2004

Simpson Centre for Reproductive Health

Complete during PCA and for 12 hours after epidural/spinal opioids

Record loading dose given in recovery here →

Q1 to Q4 Refer to antibiotics given **within** and **upto 24 hours following C/S surgery**

Q1. Date antibiotics last given ____ / ____ / ____ **Q2. Time antibiotics last given** ____ / ____ / ____

Q3. Was antibiotic prophylaxis in line with local guidelines Yes ☐ No ☐

Q4. Has patient received more than one dose Yes ☐ No ☐

If yes, reason why ?

Q5 Refers to antibiotics given due to c-section wound / uterine infection / pyrexia / query infection.)

Q5. Is patient receiving antibiotics for more than 24hs after surgery Yes ☐ No ☐

Q6. If yes, reason why ?

Q7. Surgical Site Infection? ☐ Yes (fill out **Q8** below) ☐ No (Go to **Q10**)

Q8. Tick all that apply (criteria in bold constitute an SSI when used alone)

☐ **Purulent Drainage**
☐ Localised pain or tenderness
☐ Localised Swelling
☐ Incision spontaneously dehisces
☐ Redness
☐ Incision is deliberately opened by surgeon
☐ Heat
☐ Fever (temperature 38 degrees or more)
☐ **Abscess/other evidence found during direct exam, a re-operation or radiology/histopathology**
☐ **Organisms isolated from an aseptically obtained culture of fluid, tissue, blood, bone or biopsy**
☐ Diagnosis by surgeon or trained healthcare worker
Method of diagnosis: ☐ Organisms isolated from swab ☐ Other

Q9. Date of Confirmed Surgical Site Infection ____ / ____ / ____

Q10. Date of Discharge, Transfer or Death ____ / ____ / ____

UHPI: 600101156L	Age: 35	Parity: 1+0	EDD: 29 Aug 2011	Blood Gp: O Rh Negative

This is your Pregnancy Record. It contains important information that will be used to help you and your maternity care team plan care for you and your baby. You will usually be asked to carry your record during your pregnancy, as this will help communication between you and your maternity care team.

Some women may prefer not to carry their Pregnancy Record. If you do not want to carry your record, please tell your midwife. Your midwife will arrange to hold your record for you, or for it to be kept at the maternity unit or your GP practice.

Please keep your Pregnancy Record safe, confidential and protect it from damage. If you lose your Pregnancy Record, please contact your midwife or maternity unit as soon as possible.

Please remember to take your record with you to all health appointments during your pregnancy. For example, whenever you see your midwife, GP, obstetrician, physiotherapist or when you go for an ultrasound scan. Nearer the time when your baby is due, you may want to carry your Pregnancy Record with you when you go out and about.

Your Pregnancy Record remains the property of your NHS Board. At the end of your maternity care it will be returned to the NHS Board where it will be stored safely. If you would like a copy of your completed record, please speak to your midwife or contact the data controller of the NHS Board responsible for your care. (There may be a small charge for this.)

Details about how your personal information is used by staff within NHSScotland can be found in the leaflet 'Protecting Personal Information'. This is available from your midwife, GP practice or on-line at <http://www.show.scot.nhs.uk/confidentiality> (see under 'patient guidance').

When is your baby due? - Your "Estimated Date of Delivery" or EDD
This information is used to work out when your baby is due. This is called your estimated date of delivery (EDD). It is helpful to think of your EDD as a "rough guide". Most babies are born during the fortnight before, or the fortnight after your EDD.

Agreed EDD:	29 Aug 2011
Date of the first day of bleeding of your last menstrual period (LMP):	20 Nov 2010
How sure are you of this date:	Certain
Average number of days between the first day of each period (monthly cycle):	
Have you had any vaginal bleeding since your last menstrual period:	No
Had you been using any contraception:	
Type:	
Date Stopped:	
Provisional EDD based on LMP and monthly cycle:	27 Aug 2011
EDD using dating scan:	
Agreed by:	Catriona G Miller

Your previous pregnancies
Is Current Pregnancy with a New Partner? Yes

Parity: 1+0

Pregnancy 1

Full Name		Date of birth	12 Feb 2001
Sex	Male	Gestation	40.6

Have you ever injected drugs/referrals	/

Does your current partner use any street drugs, gas or glue Details, information given and referrals Referral for advice on substance abuse Details, information given and referrals	Oral No	IV No

Family Health (inc. Mental health)

Disease/ Details	
Do you have a close family member (parent or sibling) with a history of bipolar disorder (manic depression) or any other serious mental illness	No

Ethnic origin

The term ethnic origin is to describe where your family originates from, as distinct from where you were born. This information will help us to decide which blood screening tests you should be offered and whether your baby may need a BCG (TB) vaccination.

How do you describe your ethnic origin	Scottish
How do you describe baby's fathers ethnic origin	
What language do you usually use at home	English
Do you need help with interpreting, communicating	No
What is your current religion or faith, if any	No Religious Affiliation
Is blood transfusion acceptable to you	Yes
Female circumcision	No
Are you a refugee or asylum seeker	No

Medication

Are you taking any medication prescribed to you by a doctor, or have you stopped any medication recently	Yes
Prescribed Medication	AVenlafaxine 75 mgs stopped end Dec 10 when pregna

No Home circumstances and support needs

Blood tests and other tests

During your pregnancy you will be offered several blood tests to check on your health and your baby's health. Your midwife will give your information leaflets on many of these tests. Maternity care staff will discuss all the blood tests with you. When you are sure that you understand about the tests, you will be asked if you want to have them done or not, and your wishes will be followed. For some of the blood tests you will be asked to sign a consent form.

Maternity care staff will tell you how to find out the results of any tests that you have. They will also organize any follow up care that may be needed.

Results should be filed between the 'your notes and questions pages' near the back of the notes so that they do not obscure the 'Special Features' boxes. Computer print outs can be hold punched and tagged into the record or the 'mount sheet' can be used for smaller results.

Test	Date Taken	Date when test due
Blood group	01 Feb 2011	
Full blood count	01 Feb 2011	
Rubella status	01 Feb 2011	
Syphillis	01 Feb 2011	
Hepatitis B	01 Feb 2011	
HIV	01 Feb 2011	
Screening for Spina Bifida/Downs Syndrome		
Antibody check	01 Feb 2011	
Random blood glucose	01 Feb 2011	
Haemoglobinopathy - sickle cell and thalassaemia		
Chlamydia (if under 25)		
Mid stream urine specimen for bacteriology	01 Feb 2011	
Which test decline, including reason	Virology bloods taken today as unable to do at booking 15/03/11	
Test Results - action		

If you have Rhesus Negative blood

Has this been discussed / plans made	
Signed	June T Millar

Comments/ Is there any other information that you feel is important for your maternity care? For example your beliefs, social conventions and customs, family structure, ceremonies, dress or diet	Delighted to be adding to family will be well supported throughout by partner and family. Wishes to be referred for smoking cessation and will ask if partner wishes also and will let us know and can be referred together at next appt. Was in care for very short period as a child due to behavioural problems which are now resolved. No further S/W involvement.

Infant feeding - Antenatal checklist	Discussed
Benefits of breastfeeding to the baby (protects against gastro-enteritis and diarrhea, urinary tract infections, ear infections and chest infections; may also protect against allergies and diabetes)	No
Benefits of breastfeeding to the mother (protects against breast cancer, ovarian cancer and hip fractures in later life)	No
No other food or drink needed (for up to 6 months)	No
Importance of skin-to-skin contact after delivery (keeps baby warm and calm, promotes bonding, helps breastfeeding)	No
Importance of good positioning an attachment	No
Getting feeding off to a good start	No
Baby led feeding	No
Problems with using teats, dummies, nipple shields	No
Help will be available with feeds	No
Importance of rooming-in/keeping baby nearby	No
Baby's sleeping place	No
Leaflets given and discussed	Yes

CLINICAL INFORMATION

History of presenting complaint / examination findings / investigation results

Presenting complaint

Description: Pregnancy.

Comment: Dear Midwives

This patient had a positive home pregnancy test on 23 December 2010. Her LMP was approximately 20 November 2010.

Please note that she has a PMH depression and is currently on Venlafaxine 75mg daily. She will be reviewed before her next prescription.

I would be grateful if you would provide antenatal care as appropriate.

Kind regards.

If you find this record, please return it to the nearest Maternity Unit or General Practitioner surgery as soon as possible.

This is your Postnatal Record. It contains important information that will be used to help you and your maternity care team plan care for you and your baby. You will usually be asked to hold your record when you receive care at home/when you have been discharged home from a maternity unit. This will help communication between you and your maternity care team.

Some women may prefer not to hold their Postnatal Record. If you do not want to hold your record, please tell your midwife. Your midwife will arrange to hold your record for you, or for it to be kept at the maternity unit or your GP practice.

Please keep your Postnatal Record safe, confidential and protect it from damage. Please take it with you if you have any appointments at your health centre, GP practice or maternity unit. If you lose your Postnatal Record, please contact your midwife or maternity unit as soon as possible.

You can write in your Pregnancy Record where you see this symbol: 

Your Postnatal Record remains the property of your NHS Board. At the end of your maternity care it will be returned to the NHS Board where it will be stored safely with the rest of your maternity record. If you would like a copy of your completed record, please speak to your midwife or contact the data controller of the NHS Board responsible for your care.

Details about how your personal information is used by staff within NHSScotland can be found in the leaflet 'Protecting Personal Information'. This is available from your midwife, General Practitioner or on-line at **http://www.show.scot.nhs.uk/confidentiality** (see under 'Patient Guidance').

Your postnatal care

The chart below is used to plan your postnatal care. Your midwife (and sometimes other members of your maternity team) will discuss and arrange your care with you, according to your needs and your baby's needs. Maternity staff will explain the reasons for each appointment or visit, as well as where it will take place, who with and when.

Day	Date	Time*	Reason for visit/appointment	Where & who with

*For some home visits an approximate time or 'morning' or 'afternoon' visit may be given.

Your notes

Please use this space to jot down any notes or questions about your care or your baby's care.

Feeling confident with your baby

Whether you are a first time parent, or if you have experience of looking after new babies, there may be things that you want to discuss and practice with maternity care staff. The list below can be used as a starting point to ensure that you feel confident meeting your baby's needs. Please sign off the items when you feel ready. Remember there can be lots to learn, and it can be quite normal for this to take a while.

Don't forget that your 'Ready, Steady, Baby!' book contains useful advice and information that you and your partner/supporter can refer to.

	Discussed/demonstration Date/signed (staff)	I feel confident Date/signed (mum/partner)
Handling my baby safely	...../...../.....	...../...../.....

Breastfeeding your baby

Breastfeeding your baby may be a new experience for you, or you may already have skills and confidence. This section contains items for discussion, observation and support as you breastfeed your baby. Your midwife and maternity care team will support you. When you and your midwife feel you are confident with the items, you can then sign them off to mark your progress.

Your copy of 'Off to a Good Start: All you Need to Know about Breastfeeding your Baby' provides sound advice that you and your partner can refer to. Please let your midwife know if you need another copy.

Other things about feeding that I want to ask about: .....

Your questions or concerns

Being a parent with a new baby can be challenging and exciting, but also tiring and stressful. The following section is for you to write in. Please jot down anything that you or your partner wish to discuss with your midwife/the maternity team caring for you. Here are some suggestions:

How I feel I am coping

My mood and emotions

How I feel I am doing as a parent

Not liking my baby at the moment

Difficulties with my baby's feeding

Managing my tiredness

Questions about my baby

Coping with my baby's crying

My anxieties

Relationships with my family

Thinking about your pregnancy, labour and birth

Pregnancy, labour, birth and the time afterwards are unique experiences. They can have a powerful effect on how you feel and your relationships with your baby, partner, family and your maternity care team.

Your midwife will ask you about your experiences in the early days following the birth. You may have questions that you want to ask or issues to discuss – or you may not. You may find it helpful to think about your experiences of maternity care so far, and discuss events with your partner or the person supporting you. Please use the space below to jot down any questions or issues to discuss.

Please remember that you can talk to any member of your maternity care team (such as your midwife, General Practitioner or obstetrician) about your experiences *at any time after the birth*. Some women wish to do this a few weeks, or even many months after the birth, or if they are thinking about becoming pregnant again.

Consent for Newborn Blood Spot Screening for Phenylketonuria, Congenital Hypothyroidism & Cystic Fibrosis

I have received and read the information leaflet "A Parent's Guide to Newborn Blood Spot Screening for Phenylketonuria, Congenital Hypothyroidism and Cystic Fibrosis" and have had an opportunity to discuss the tests I am being offered with a health professional. I understand the reasons for the tests and the consequences of the results. I also understand the significance of not having these tests performed. I am aware that my decision whether or not to have these tests will not affect the quality of care delivered by healthcare professionals.

Baby's Name Date of birth / /

CHI Number

☐ I wish ☐ I do not wish my baby to be tested for Phenylketonuria

☐ I wish ☐ I do not wish my baby to be tested for Congenital Hypothyroidism

☐ I wish ☐ I do not wish my baby to be tested for Cystic Fibrosis

We also need to obtain your permission to store the blood spot card beyond the 12 month testing period and to use any of the blood spots left over after testing is complete for anonymised research, such as the development of new screening tests. If any research was proposed in which the researcher would be able to identify you or your baby, we would always contact you again to seek your approval.

☐ I agree ☐ I do not agree for the storage of my baby's blood spot specimen beyond the 12 month testing period

☐ I agree ☐ I do not agree to the use of any left over blood spots for anonymised research

INFORMATION FOR WOMEN WITH RHESUS NEGATIVE BLOOD GROUP - ANTENATAL ANTI-D INJECTIONS

SCOTTISH NATIONAL BLOOD TRANSFUSION SERVICE

During pregnancy, it is possible that some of the baby's blood may cross the placenta and get into your bloodstream. In most cases this cannot be detected in your blood.

So, why does this matter?

In most cases it does not matter. However, if your baby's blood group happens to be Rhesus positive and your blood group is Rhesus negative, problems may occur. This is because your body may make molecules (or antibodies) to your baby's Rhesus positive red blood cells. This happens in about 15 in every 1000 women.

These molecules won't cause problems in this pregnancy, but in a few cases, in future pregnancies, the molecules can cross back to the baby and destroy the baby's blood cells. If this is severe, the baby can become very anaemic. In the unlikely event that this happens, treatment is almost always successful.

How can I stop these antibodies causing problems in future pregnancies?

You will be offered two injections of anti-D. The anti-D covers the surface of the baby's blood cells which might be in your bloodstream, and reduces the chance of your body making the antibodies that destroy the baby's blood cells. Each injection is made up of less than half a teaspoonful of clear fluid and is injected into a muscle, often the one at the top of your arm, or your buttock. It takes only a few seconds to give the injection, and is no more uncomfortable than the scratch you feel when you have a blood sample taken.

How often do I need these anti-D injections?

You will be offered them at approximately 28 weeks and 34 weeks. This greatly reduces the risk of developing antibodies to your baby's blood (from 15 in 1000 to less than 2 in 1000 chances).

If you have other problems during your pregnancy, such as bleeding, or tests such as amniocentesis (where some of the fluid around the baby is taken out to do other tests), you will be offered additional anti-D injections at the time these events happen. This is because we know that some of your baby's blood cells will cross the placenta into your bloodstream after these events (called sensitising events), and so extra doses of anti-D are needed at these times in order to reduce the chance of your body making the antibodies that destroy the baby's blood cells.

In some circumstances, you may wish not to have the injections at 28 and 34 weeks. These situations include if you have decided to be sterilised after the birth of this baby, or if you are certain that you will not be having another baby after this one, (both situations where you won't be having another pregnancy) or if you know that the father of this baby is also Rhesus negative (baby will be Rhesus negative also).

So, if you think you are in one of these categories, please discuss this with your midwife, but remember that you may change you mind in the future about having more children, and you may not know the Rhesus status of your partner.

Do I still need an injection after my baby is born?

Probably, yes. More of your baby's blood can get into your bloodstream during labour. After delivery the baby's blood group is tested. If your baby is **Rhesus negative**, you do not need any more anti-D injections because you can only form antibodies against Rhesus positive cells.

If your baby is **Rhesus positive**, this will confirm that you will be able to form antibodies against your baby's blood cells. You will be offered a further anti-D injection to try to prevent this because the antibodies could cause problems in future pregnancies. If a lot of your baby's blood has passed into your bloodstream, more than one injection may be necessary to cover the surface of all the cells. Your blood will be tested after delivery to find out if more than one injection is needed.

Are there any risks to these injections?

They have an excellent safety record. The anti-D injections are made from donated blood, which is screened for infections that can be passed on from it. The anti-D is made in Scotland from plasma from the USA. (American plasma is now used to avoid the already tiny risk of new variant CJD (BSE) in blood from British donors).

Anti-D injections have been used in pregnancy for over 30 years. In Scotland there have been no cases of infections being caught from such injections, and there have also been no cases of infection from the USA product in over 24 years. Many, many millions of injections have been given with no known problem.

- The Royal College of Obstetricians & Gynaecologists recommends routine antenatal anti-D prophylaxis.

Note: If you already have anti-D in your blood from a previous pregnancy, then you may not need any anti-D injections.

<u>If you have any further questions, please ask your midwife or your own doctor.</u>
